

When it comes to data disposal, 99% security is no security at all

DATA ERASURE

Issues of security with end-of-use IT equipment are vital to all organisations, whether they are large or small. Even the smallest of errors can result in catastrophic losses of a company's credibility and trust. Anybody not taking the matter of data disposal in earnest, risks a devastating and often unrecoverable disaster.

To manage this process JUST Recycle IT offers a secure data erasure service with a secure chain of custody for the removal and transportation of sensitive data.

Many people believe that formatting a hard drive or floppy disc eradicates all data on that disc; this is not the case. With today's sophisticated software, it is a simple process to recover all of the information previously held on a formatted disc. Two ways to totally erase this data are to utilise certified data erasure software (to stamp out the magnetic signature by overwriting it many times with more data), or to physically degauss the hard drive.

Irrespective of the solution you choose, it is critical that all existing data and identification is removed from your storage media.

Three major areas of risk for not doing so include:

- Your hard discs or other storage media potentially containing confidential customer or employee information, which could breach Privacy Act legislation, if it was accidentally released.

- You could compromise your own competitiveness if sensitive commercial information is left on the storage media.
- Software licensing agreements could be breached if programs are not removed.

Our methods are scrupulously thorough, meeting CESA INFOSEC 5, a standard that meets the US Department of Defence criteria and as part of our service, we can provide a Certificate of Data Integrity and Erasure.

Any faulty hard discs or media are degaussed. Any media erased with the degausser will be destroyed together with the information on it. Your redundant IT assets can then be remarketed, redeployed or recycled.
